

1 **ABSTRACT**

2 Systems and methods are described for providing a standard list function to
3 create a graphical user interface list and list manager while allowing the graphical
4 user interface to vary by appearance. An application developer can include a list
5 manager control in an application. Properties are set that link the list manager to
6 display controls, a data source and a scrolling behavior source. The list manager
7 provides the appropriate content to the display controls in response to user
8 selections of the display controls. The display controls and a user interface that
9 contains them may vary without altering the basic functionality of the list
10 manager.
